

Steel fibre reinforced shotcrete

This shotcrete is particularly suitable for temporary rock strengthening and permanent structures in tunnel or mining work.

Reinforced safety

Steel fibre reinforced shotcrete is a ready-mixed concrete designed for wet spraying. The steel fibres provide toughness and strength to the product, which makes it particularly suitable in structures with high demands on the load carrying capacity. You can vary the composition and properties according to project specification. Technical Customer Service will be pleased to help you with tips and advice.

Guaranteed quality

As we produce shotcrete in our own plants, we are able to monitor both incoming materials and the production process itself. You can therefore be sure of a product which maintains a high and uniform quality over time.

Areas of application

- Continuously reinforced rock strengthening
- Permanent concrete structures in tunnel and mining work
- Repair and refurbishing of existing concrete structures

Technical summary

- Shotcrete with steel fibre reinforcement
- Composition and properties are varied according to the specification of requirements
